| Geothermal vs. Air-Source Heat-pump Systems prepared by David L. Faulkner, July 2012 |  |   |  |  |  |  |  |  |
|--|--|---|--|--|--|--|--|--|
| Consideration  | Air-Source   | Geothermal  |  |  |  |  |  |  |
| Initial cost (purchase<br>price and installation):                                   | \$3,000 - \$20,000 depending on<br><b>model</b> (different models have<br>different efficiency ratings with<br>the most efficient having the<br>highest initial cost, but lower<br>operating costs) <b>and</b> depending<br>on <b>size</b> (2-5 tons most common<br>for residential models); | \$10,000 - \$32,000 depending on model (the most efficient have the highest initial cost, but lower operating costs), depending on size (2-5 tons most common for residential models), depending upon type of thermal exchange loop installed (vertical loops are the most efficient, but require a drilling rig and are more expensive; horizontal loops are less expensive, but a little less efficient) and depending upon the geology (soft sedimentary rock is easier and less expensive to drill into as compared to granite for example – Woodlake sits on top of sedimentary marine deposits that are easy/less costly to drill through); |  |  |  |  |  |  |
| Federal tax credit:  | None currently available   | 30% of installed cost (no maximum);   |  |  |  |  |  |  |
| Annual maintenance cost:   | \$60-\$150 depending upon service<br>provider and if you get just an<br>inspection or full service;  | \$60-\$150 depending upon service provider and if you get just an inspection or full service;   |  |  |  |  |  |  |
| Use of air filters:  | At in-house ductwork returns and/or at the air-handler;  | At in-house ductwork returns and/or at the<br>compressor/air-handler unit;  |  |  |  |  |  |  |
| Cost of air filters:   | From approx. \$1-\$65 each<br>depending upon thickness and<br>quality;   | From approx. \$1-\$65 each depending upon<br>thickness and quality (we use cheap ones at the<br>returns and high quality filters at the unit);  |  |  |  |  |  |  |
| Key components:  | Compressor and heat-exchange fan; air-handler;   | Combined compressor and air-handler in a single unit;   |  |  |  |  |  |  |
| Location of key components:  | Compressor and fan: outdoors;<br>Air-handler: crawl-space or<br>indoor somewhere (typically in a<br>closet, garage, basement or attic);  | The entire unit is typically either located in the crawl-space, garage, a utility room or basement;   |  |  |  |  |  |  |
| Ease of installation   | Usual installation is easy;  | Installation of the heat-exchange loop can be very disruptive and messy in the short-term;  |  |  |  |  |  |  |
| Exposure to outdoor elements:  | The compressor and fan are completely exposed;   | Entire unit is completely protected from the sun,<br>wind, rain, temperature fluctuations that cause<br>shrinking, swelling and frost heaves, acidic<br>droppings from birds/other animals, etc.  |  |  |  |  |  |  |
| Performance sensitive to air temperature?  | Yes, don't perform best in<br>extreme heat and cold, operating<br>best between 50-85 degrees<br>Fahrenheit;  | No, only sensitive to the temperature of the earth<br>which is relatively constant below 10ft. (horizontal<br>loop systems are typically installed 5-8ft. deep);  |  |  |  |  |  |  |
| Site limitations?  | None   | Vertical loops: sites with hard rock geology cost<br>more to drill through, but have superior thermal-<br>conductivity/heat exchange capacity; Horizontal<br>loops: sites with deep sandy soils are inappropriate<br>as they lack adequate thermal-conductivity;  |  |  |  |  |  |  |
| Accessories:   | Humidifiers, dehumidifiers   | Humidifiers, dehumidifiers and desuperheaters   |  |  |  |  |  |  |
| Expected useful life:  | 10-15 years (12 on average?)   | 20-30 years (25 on average?)  |  |  |  |  |  |  |

| System Features Comparison  |   |   |   |  |   |   |  |  |
|---|---|---|---|--|---|---|--|--|
| Type System   | Installation<br>Cost  | Annual<br>Operating<br>Cost                                     | Maintenance<br>Cost                                   | Eventual<br>Replacement<br>Cost                | Expected<br>Useful Life                             | Life-cycle<br>Cost  |  |  |
| Geo-thermal<br>heat-pump  | High  | Lowest  | Low   | Moderate                                       | Very Long   | Lowest Life-<br>Cycle Cost  |  |  |
| Air-source<br>heat-pump   | Moderate  | Moderate  | Low in early<br>years –<br>Moderate in<br>later years | Moderate                                       | Medium  | Moderate  |  |  |
| Combination<br>Systems: Air-<br>source unit for<br>cooling and<br>Combustion<br>system for<br>heating | High-Very<br>High<br>depending on<br>whether or not<br>you have to<br>install a<br>storage tank<br>underground,<br>e.g., for<br>heating fuel or<br>propane, or if<br>you have to<br>pay for a<br>supply<br>pipeline<br>installed for<br>natural gas and<br>how long it<br>has to be | Moderate<br>depending<br>upon heating<br>fuel source<br>markets | Moderate-<br>High                                     | Moderate for<br>each system =<br>High together | Medium for<br>Air-source,<br>Long for<br>Combustion | Moderate for<br>Air-source and<br>Moderate to<br>High/Very<br>High for<br>Combustion<br>systems<br>depending<br>upon<br>installation<br>requirements<br>and heating<br>fuel source<br>markets |  |  |
